Subject-Predicate-Object Structural Intelligence

SPO-SI | ResearchGate Overview | Initial Research Release v0.1.0 | 26 October 2026

KEY IDEA

SPO-SI explores a subject-centered structural intelligence framework that connects **Subject** (who perceives and acts), **Predicate** (relations, transformations, and governed operations), and **Object** (what is represented, evaluated, or changed). It treats structural relay, shared world models, and recursive evolution as research directions rather than validated system capabilities.

RESEARCH SCOPE

Subject and world models: Subject boundaries, perspective-dependent representation, and shared environments.

Predicate and governed action: Structural relationships, operational contracts, and decision/action governance.

Object and structural relay: Portable representations, interoperability, and subject-object transformations.

Open structural evolution: Composable intelligence units, counter-evidence, and testable growth hypotheses.

REPOSITORY CONTENTS

Six core SPO research papers; four relay specification drafts; eight architecture figures; research questions, hypotheses, and validation planning; navigation and citation metadata.

RECOMMENDED READING PATH

README.md → START-HERE.md → CONTENTS.md → core research papers → relay specifications → validation roadmap.

RESEARCH STATUS

Exploratory research, v0.1.0. The architecture and interfaces are proposals. Claims of generality, effectiveness, and recursive improvement require future implementations, benchmarks, and independent validation.
